

Demonstration

- Goals:
 - **Integrate all the modules** to make an automated remote sensing pipeline (observe -> process -> predict -> task).
 - Perform a medium-fidelity brassboard demonstration of all the modules developed over the course of the project in a **simulated operational environment**.
 - Evaluate performance in critical areas. **Compare against existing similar products and/or evaluate accuracy.**
 - Enable a **TRL 5 exit**.
- Period of **12 days**: 29 June 2026 to 10 July 2026.
- Modeled on the **7 satellite CYGNSS** constellation.
 - While the system produces commands for the CYGNSS satellites, it is *not* executed.
- Mostly **automated runs** of the different system modules.
 - Automated: Only manual component is to click “Start” at a predefined time everyday.
- Console to visualize the resulting products generated over 12-day duration.

Demonstration

- **Distributed module execution**, with each module executed at different hardware machines, and software environments.
- All data is posted and exchanged on **Cloudflare R2 buckets**.

Demonstration: Timeline
